On two-column pages the guess fails at every figure, every table, and every footnote. We therefore treat stream order as authoritative and only intervene where a page has no text layer at all. Running heads are the second source of noise, because they repeat on every page and sit exactly where a heading would. Position alone cannot separate the two: a section title drawn at the top margin looks like a header to any rule that only inspects coordinates.

1995. The first survey was run in that year and covered forty firms in two regions.

The checks were the following:

- coverage of both regions
- a second coder for every file
- a record of each exclusion

Position alone cannot separate the two: a section title drawn at the top margin looks like a header to any rule that only inspects coordinates. Repetition can, since a header recurs across pages while a title appears once. The benchmark documents in this study were built to exercise those two decisions and nothing else. Each document is short, synthetic, and free of copyright, so it can be redistributed with the converter.

- 4 is the change in the index after the second survey, a fall and not a range.

* Alder, J. A., & Succi, M. J. 1996. Determinants of profound change. *Fixture Quarterly*, 41: 507-529.

Each document is short, synthetic, and free of copyright, so it can be redistributed with the converter. Hyphenation across a column break is a small case that reveals whether continuation logic inspects the trailing character of a line. A converter that joins lines with a space will emit a broken word at every such break. Tables were drawn with visible ruling lines so that the vector-based detector fires before the text-alignment fallback.
