

## 4 Requirements

The text-layer path handles digital publications; a raster copy of the same file drives the recognition path. Both paths converge on the same block structure before any processor runs. Nothing in the pipeline depends on a downloaded model, which is the constraint that motivated the project. Line heights are clustered to recover heading levels when a document has no section numbers.

| Criterion   | Requirement                                                                                                                                                                   | Assessment           |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| C1 Boundary | All subsidiaries must be reported and included within the parent company inventory in accordance with the chosen consolidation approach, and any exclusion must be justified. | Met if all included  |
| C2 Gases    | All relevant gases required by the protocol must be covered; exclusions must be justified and stay below five percent of the inventory and target boundary.                   | Met if none excluded |
| C3 Scopes   | At least one target covering scope 1 and scope 2 must be submitted, combined or separate, when each is above the exclusion threshold of five percent.                         | Met if both covered  |

When numbers are present they win, because a numbered heading states its own depth. Captions are recognised by their leading label and attached to the nearest figure or table above them. Equations are left as images for a later pass rather than transcribed into notation that would be wrong half the time. The remaining processors are direct ports and are documented against the source files they come from.

Every threshold in the code was set by looking at a failure, not by tuning against a corpus. That makes the thresholds easy to defend and easy to revise when a new failure appears. We report where the approach breaks so that a reader can decide whether it fits their documents. Multi-line table cells remain the weakest point and are listed as partial support.
