a b s t r a c t

This study examines how researchers interpret organizational decisions when different groups expect different outcomes. We compare several independent observations and preserve the distinction between the title, the author information, and the abstract itself. Our evidence shows that a publication layout can resemble a table without containing data records. The actual numerical table below reports separate results and must retain its original cells, even when it appears on the first page of a journal article.

Abstract

This study examines how researchers interpret organizational decisions when different groups expect different outcomes. We compare several independent observations and preserve the distinction between the title, the author information, and the abstract itself. Our evidence shows that a publication layout can resemble a table without containing data records. The actual numerical table below reports separate results and must retain its original cells, even when it appears on the first page of a journal article.

Keywords: organizations, decisions, evidence

Group	Observed	Expected
Alpha	12	15
Beta	18	21
Gamma	24	27

First-page booktabs control

Group	Observed	Expected
Alpha	12	15
Beta	18	21
Gamma	24	27

The measurements above are independent records.
